

## IN THE CLAIMS

Please amend the claims as follows.

For the Examiner's convenience, a list of all claims is included below.

1. (Currently Amended) A method comprising:

reading a time of exiting a reduced power consumption state immediately  
prior to exiting the reduced power consumption state, wherein exiting is caused by  
execution of an interrupt routine;

storing the time of exiting the reduced power consumption state in a register  
immediately prior to exiting the reduced power consumption state;

and

calculating a reduced power consumption state duration based on the time of  
exiting the reduced power consumption state stored in the register.

2. (Previously Presented) The method of claim 1 wherein the reduced power  
consumption state is entirely responsive to the interrupt routine.

3. (Original) The method of claim 1 furthering comprising:

reading a time of entering the reduced power consumption state;

storing the time of entering the reduced power consumption state in a main  
memory; and

calculating the reduced power consumption state duration utilizing the time  
of entering and the time of exiting the reduced power consumption state.

4. (Canceled)

5. (Original) The method of claim 1 wherein the register is located in a processor.

6-47 (Canceled)

48. (Currently Amended) An apparatus comprising:  
an operating system to read a time of entering a reduced power consumption state, and  
to read a time of exiting the reduced power consumption state immediately prior to exiting the reduced power consumption state, wherein exiting is caused by execution of an interrupt routine; and  
a main memory to store the time of entering.

49. (Previously Presented) The apparatus of claim 48 further comprising a chip to store the time of exiting the reduced power consumption state in a register.

50. (Previously Presented) The apparatus of claim 48 further comprising a processor to store the time of exiting the reduced power consumption state in a register.

51. (Previously Presented) The apparatus of claim 49 wherein the operating system further operates to perform a cycle to the chip.

52. (Previously Presented) The apparatus of claim 48 wherein the operating system further operates to calculate a reduced power consumption state duration.

53. (Previously Presented) The apparatus of claim 48 wherein the reduced power consumption state is entirely responsive to the interrupt routine.

54. (Currently Amended) An apparatus comprising:

an operating system to request a chip to store a time of entering a reduced power consumption state and a time of exiting the reduced power consumption state immediately prior to an interrupt routine causing an exit the reduced power consumption state; and

the chip to store the time of entering and the time of exiting the reduced power consumption state in a register and to automatically calculate a reduced power consumption state duration.

55. (Previously Presented) The apparatus of claim 54 wherein the reduced power consumption state is entirely responsive to the interrupt routine.

56. (Currently Amended) An apparatus comprising:

means for reading a time of exiting a reduced power consumption immediately prior to an interrupt routine causing an exit the reduced power consumption state;

means for storing the time of exiting the reduced power consumption state in a register; and

means for calculating a reduced power consumption state duration.

57. (Previously Presented) The apparatus of claim 56 further comprising:  
means for reading a time of entering the reduced power consumption state;  
means for storing the time of entering the reduced power consumption state  
in a main memory; and  
means for calculating the reduced power consumption state duration  
utilizing the time of entering and the time of exiting.
58. (Previously Presented) The apparatus of claim 56 wherein the reduced  
power consumption state is entirely responsive to the interrupt routine.
59. (Previously Presented) The apparatus of claim 56 wherein the register is  
located in a personal computer chipset.
60. (Previously Presented) The apparatus of claim 56 wherein the register is  
located in a processor.
